                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   3059 CTGGAGAACTACTGCAACTAGGCCCACCACTACCCTGTCCACCCCTCTGCAATGAA 3118
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence is the plasmid vector pDIP/PyCSP.1. The vector comprises a gene encoding Plasmodium yeeli dircumsporozoite protein (PyCSP), operably linked to promoter from Cytomegalovirus (CMV.IE). The expression of the CSP gene results in the production of an immune response to the malaria protein and a reduction in malaria parasites at the pre-erythrocytic, erythrocytic, and gametocyte stages of infection. The present sequence can therefore be used as a malaria vaccine. The present sequence has human and rat components also: partial human IL-2 sequence and partial rat preproinsulin II sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    171 GAGGGAIGGIAACAGGAIGIGIAGGIIIIIGGAGGCCCATAIGICCAIICAIGACCAGIGA 230

                                                                                                                                                                                                                                                                                                                                                                                                                                                              This is the DNA sequence of baculovirus transfer vector pVL1393.
A claimed baculovirus transfer vector incorporates a nucleic acid (see AAT97899-901, AAT97910, AAT97915, AAT97916 and AAT97919) that encodes a recombinant protein in which the A and B chains of a ricin-like toxin are linked by a heterologus linker peptide (see AAM96880-86) that contains a cleavage recognition site for a retroviral protease such as HIV, HTLV-1 or HTLV-1. The vector provides expression of the recombinant proteins in Sf9 insect cells. The recombinant proteins can be used to selectively inhibit or destroy mammalian cells infected with a retrovirus, such as cancer cells associated with HIV or cells associated with HIV. The recombinant proteins are non-toxic until the ricin A chain is liberated from the B chain by the retroviral protease, and thus can be used to specifically target infected cells without the need for a cell binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           711 ACGTAATCATGGTCATAGCTGTTTCCTGTGTAAATTGTTATCCGCTCACAATTCCACAC 770

The present invention describes new purified and isolated nucleic acids

(II) encoding: (1) the A and B chains of a ricin-like toxin (II); and

(II) a heterologous linker, joining the two chains and including a

cleavage recognition site for a disease specific protease (III). Also

described are: (1) plasmids or bacalcovins transfer vectors that contain

(I); and (2) recombinant protein (IV) consisting of the A and B chains

of (II) joined by the specified linker. (IV), produced by expression of

(I) in host combinant protein (IV) consisting of the A and B chains

of (III) particularly for treating cancers (e.g. leucocyte

produce (III), particularly for treating cancers (e.g. leucocyte

proliferation; cancer of ovary, pancreas, breast or prostate; glioma) or

infections caused by fungi, parasites (e.g. milaria) or viruses (e.g.

cytomogalovirus (CMV), herpes, hepatitis, rhimovirus, laryngeotracheitis,

poliomyelitis or varicella zoster), also cystic fibrosis and multiple

colleonyelitis or varicella zoster), also cystic fibrosis and multiple

colleonyelitically for (III)-expressing cells and does not depend for

specificity on a cell-binding component. When used to rreat viruse

concertorade translocation from endoplasmic reticulum to cytoplasm (which

come viruses exploit to avoid immune detection), so eslectivity and

safety are further improved. (IV) are not toxic until chain A is

released and this occurs only in target cells. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           7121

(I) is useful for:
(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate
cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer in a patient;

This sequence is a fragment of the pUC 18 nucleotide sequence. The fragments is used in the course of the invention. The invention relates to pyrrole derivatives which recognise a specific DNA base sequence, and strongly bind to the adjacent base via a covalent bond. The pyrrole derivatives alkylate the base sequence, once it has been recognised. The invention also relates to an agent (made from the pyrrole derivatives) for alkylating genes, a process for producing an agent for alkylating genes, and a method for regulating the expression of a gene with a part containing the specific base sequence comprising using an alkylating agent. The compounds are useful in drug compositions for regulating expression of a gene carrying a base sequence which can be recognized then alkylated by them, e.g. in treatment of cancers.

AAAB1453 to AAAB2114 represent specifically claimed Naisseria meningitidis genomic DNA sequences, AAAB1260 to AAAB150 to AAAB150 to AAAB160 to AAAB1303 and AAB25620 to AAB2563 represent Neisseria DNA sequences and their corresponding proteins, AAAB1254 to AAAB1259 and AAAB1304 to AAAB1321 represent PCR primers used in the isolation of Neisseria meningitidis DNA sequences; and AAAB1322 to AAAB1252 represent Neisseria meningitidis Memb Polymucleoride ORF sequences, which are all used in the exemplification of the present invention. The nucleic acid sequences, protein sequences, and antibodies

against them, can be used in the manufacture of a composition. The composition can be used as a medicament (or in the manufacture of a medicament) for treating, preventing or diagnosing infection due to a medicament) for treating, preventing or diagnosing infection due to be separable bacteria. For example, some of the identified proteins could be components of vaccines against Meningococus B; against all serotypes; and/or against all pathogenic Neissariae. Identification of sequences particularly organism-specific probes. Attempts to make efficacious Meningococus B vaccines have failed mainly due to antigen tolerance. Multivalent vaccines have failed mainly due to antigen colerance. Multivalent vaccines have also been tried but none have successfully overcome antigenic variability. The provision of further, complete sequences may provide an opportunity to identify secreted or surface expended professionally variable or at least more conserved than other more variable regions.
                                                                                                                                                                                                                                                                                                                                                                                                    0

```
The invention relates to an isolated nucleic acid molecule (I) comprising a nucleotide sequence given in Tables 1-9 (ABV0010-ABV62213) of the specification or its complement. (I) is useful for:

(a) assessing whether a patient is afflicted with prostate cancer;
(b) monitoring the progression of prostate cancer in a patient;
(c) assessing the efficacy of a test compound to inhibit prostate cancer in a patient;
(d) assessing the efficacy of a therapy for inhibiting prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        712 GGTAATCATGGTCATAGCTGTTTCCTGTGTGAAATTGTTATCCGCTCACAATTCCACACA 771

The present invention describes immunogenic portions of lung tumourassociated proteins (I) and the nucleic acids (NAs) that encode them.

(I) have cytostatic activity and can be used in gene therapy, antisense inhibition and in vaccines. The NAs and the lung tumourassociated to proteins they encode may be used in the prevention, treatment and proteins they encode may be used in the prevention, treatment and cangodists of diseases associated with their inappropriate expression, especially lung cancers. For example, the NAs may be administered to creat diseases by rectifying mutations or deletions in a patient's genome that affect the activity of the protein by expressing inactive proteins or to supplement the patients own production of (I). Additionally, the NAs may be used to produce the lung-tumour associated protein, according to standard recombinant DNA methodology. Conversely, antisense NAs may be used to produce the lung-tumour associated protein according to standard recombinant DNA methodology. Conversely, antisense NA molecules may be administered to down regulate protein expression by and complementary sequences may also be used as DNA probes in diagnostic assays to detect and quantitate the presence of similar NA sequences in cancer. The (I) may be used as antigens in the production of antibodies and in assays to identify modulators (agoniets and antagonists) of the expression and activity of the protein. APF80803 to AAP58819 and AAB76818 represent human lung tumour protein related necession and protein sequences which are used in the exemplification
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            217 ATTAATGAATCGGCCAACGCGGGGGGGGGGGTTTGCGGTATTGGGCGCTCTTCCGCTT 276

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention describes an isolated polynucleotide and polypeptide useful for stimulating and/or expanding T cells specific for a tumour protein for determining the presence of a cancer in a patient. A composition containing the polynucleotide and/or polypeptide is useful for treating a lung cancer in a patient. The polypeptide is useful for tremoving tumour cells from a biological sample. The polynucleotide is also useful as probe or parimer to detect the level of mRNA encoding a tumour protein This sequence encodes a lung tumour associated protein recein regeneric described in the method of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CGTAATCATGGTCATAGCTGTTTCCTGTGAAATTGTTATCCGCTCACAATTCCACACA

The invention relates to a polynucleotide encoding a lung tumour protein, comprising a sequence selected from any of the 14 sequences mentioned in the specification, or a sequence ($2) mentioned in periodication, complement of $1, sequences consisting of at least 20 specification, complement of $1, sequences consisting of at least 20 contiguous residues of $1, sequences that hybridise to $1, sequences $1 having 75%, preferably 90%, identity to $1, or degenerate variants of $1 having 75%, preferably 90%, identity to $1, or degenerate variants of $1 having at least 70% preferably 90%, identity to a sequence encoded by the polynucleotide, or sequences specification, a sequence encoded by the polynucleotide, or sequence of a cancer for sequence encoded by the polynucleotide, an expression control sequence, a host cell cransformed or transfected with the vector, an isolated antibody (or its antigen-binding fragment) that specifically binds to the polypeptide, an expression control sequence, a host cell antigen-binding fragment) that specifically binds to the polypeptide, comprising the presence of a cancer in a patient, a fusion protein comprising the polypeptide, an oligonucleotide that hybridises to the polyment confitting and/or expanding T cells specific for a tumour protein (comprising T cells with
                                                                                      216
                                                                                                                                                                                      951
                                                                                                                                                                                                                                                                             276

the polynuclectide, protein or antigen-presenting cells, under conditions and for a time sufficient to permit the stimulation and/or expansion of T cells) and inhibiting the development of a cancer in a patient (by incubating CD4+ and/or CD8+ T cells isolated from a patient with the polynuclectide, protein or antigen presenting cells that express the polynuclectide, such that T cells proliferated T cells, and thus comparison to patient an effective amount of the proliferated T cells, and thus inhibiting the development of a cancer in the patient. The patient composition for complying the present and scales are useful in a composition for a patient (particularly lung cancer). The oligonuclectide is useful for determining the presence of a cancer in a patient. The protein and coligonuclectides are useful in pharmaceutical compositions, e.g. carriers. The polynuclectide is also useful as a probe or primer for nucleic acid hybridisation, and in the design and preparation of ribozyme molectides for inhibiting expression of tumour polymerclectide is consecuted in the patient patient sequence is a cDNA (full length, extended or partial)

The present sequence is a cDNA (full length, extended or partial)

Considered from a library derived from lung tumour/cancer cells. The sequence data for this patent did not form patient control of the printed specification, but was obtained in electronic control of control of the printed specification, but was obtained in electronic control of control of the printed specification, but was obtained in electronic control of the printed specification, but was obtained in electronic control of the printed specification, but was obtained in electronic control of the printed specification, but was obtained in electronic control of the printed specification, but was obtained in electronic control of the printed specification, but was obtained in electronic control of the printed specification, but were obtained and electronic control of the printed specification, but so the control of the p
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    carraarrecerrecercacreceeerriceaereeeaaacerereeeaeeeee 216

The invention describes an isolated polynucleotide comprising one of 32 sequences, complement or degenerate variants of them. The polynucleotide is useful for preparing a composition e.g. a vaccine or for gene therapy, for treating or inhibiting development of cancer, e.g. lung cancer. This sequence represents a polynucleotide associated with the compositions and methods for the therapy and diagnosis of lung cancer.
                                                                                                                                                                                                                                                                                                                            Durham M;

Method for determining open reading frames of the genome of an organism using primers at low stringency conditions, useful in the construction of contigs or constructs of sequenced nucleic acid molecules -
                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a cDNA sequence obtained using a method for determining open reading frames (ORFS) of the genome of an organism. An aliquot of mRNA from human breast cancer cells was mixed with a single, arbitrary primer, Moloney murine leukaemia virus reverse transcriptase, reverse transcriptase buffer and GNTPs. The mixture was incubated under low stringency conditions to yield single stranded CDNA. The same primer was then used to amplify the CDNA by PCR. Rather than providing nucleotide sequence information from the non-coding the more interesting and relevant internal portions, such as ORFS. The method also permits the construction of contigs of sequenced nucleic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             frames (ORPS) of the genome of an organism comprising contacting messenger RNA from a cell of the organism with a single, oligonucleotide primer at low stringency. The method is an improved ORESTS sequencing method. The methods of the present invention are useful for sequencing of, essentially, the entire coding component of an organism, identification of previously unknown nucleic acid molecules, assigning previously identified nucleotide sequences to internal regions of genes and population studies that identify genes associated with diseases such as heart diseases, bronchitle, Alzheimer's disease, autoimmune diseases and congenital diseases. This polynucleotide represents a DNA sequence that is used in the novel method of the invention.

Patent NO. 6015668

GENERAL INFORMATION:
APPLICANT: Hughes, A. John
APPLICANT: Chatteriee, Deb K.
TILLE OF INVENTION: Cloned DNA Polymerases from Thermotoga and NUMBER OF SEQUENCES. 26
CORRESPONDENCE ADDRESS:
ADDRESSEE: STERNE, KESSLER, GOLDSTEIN & FOX, P.L.L.C.
STRRET: 1100 New York Ave., N.W., Suite 600
CITY: Washington
                                                                                                             325 CCTCGCTCACTGACTCGCTGCGCTCGGTCGTTCGGCTGCGGCGAGCGGTA 374

Library constructed by N. Garrett, E. ellefroid, and A.M. Zorn
(Wellcome/CRC Institute). DNA Sequencing by: Washington University
Genome Sequencing Center
Clone distribution: Xenopus clones from this library are available
through the I.M.A.G.E. Conscrtium/LLNL at: info@image.llnl.gov
Seq primer: -40RP from Gibco
High quality sequence stops: 273.

Sequence of mapped RFLP marker cg0029 on linkage group vi of cowpea. For more information, see Beandenes at: http://ars-genome.cornell.edu/cgl-bin/MebAcc/webace?db=beangenes.cl ass=Locus. Please see as authorities for mapping/naming: Fatokun, C.A., Danesh, D., Young, N.D. (1993) RFLP linkage map for cowpea (vigna unguiculata (L.) Walp.) in: Genetic Naps., 1992. S. J. O'Brien, ed. Cold Spring Harbor Press, Cold Spring Harbor, NY, pp. 6.256.6.258 - and - Menancio-Hautea, D., Kumar, L., Danesh, D., Young, ND. (1993) RFLP linkage map for mungbean (vigna radiata (L.) Wilczek) in: Genetic Maps, 1992. S. J. O'Brien, ed. Cold Spring Harbor, NY, pp. 6.259-6.260.
Insert Length: 400 Std Error: 0.00
Seq primer: M13F
Class: RFLP probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                     / organism="Vigna unguiculata"
